

Some measures of centrality

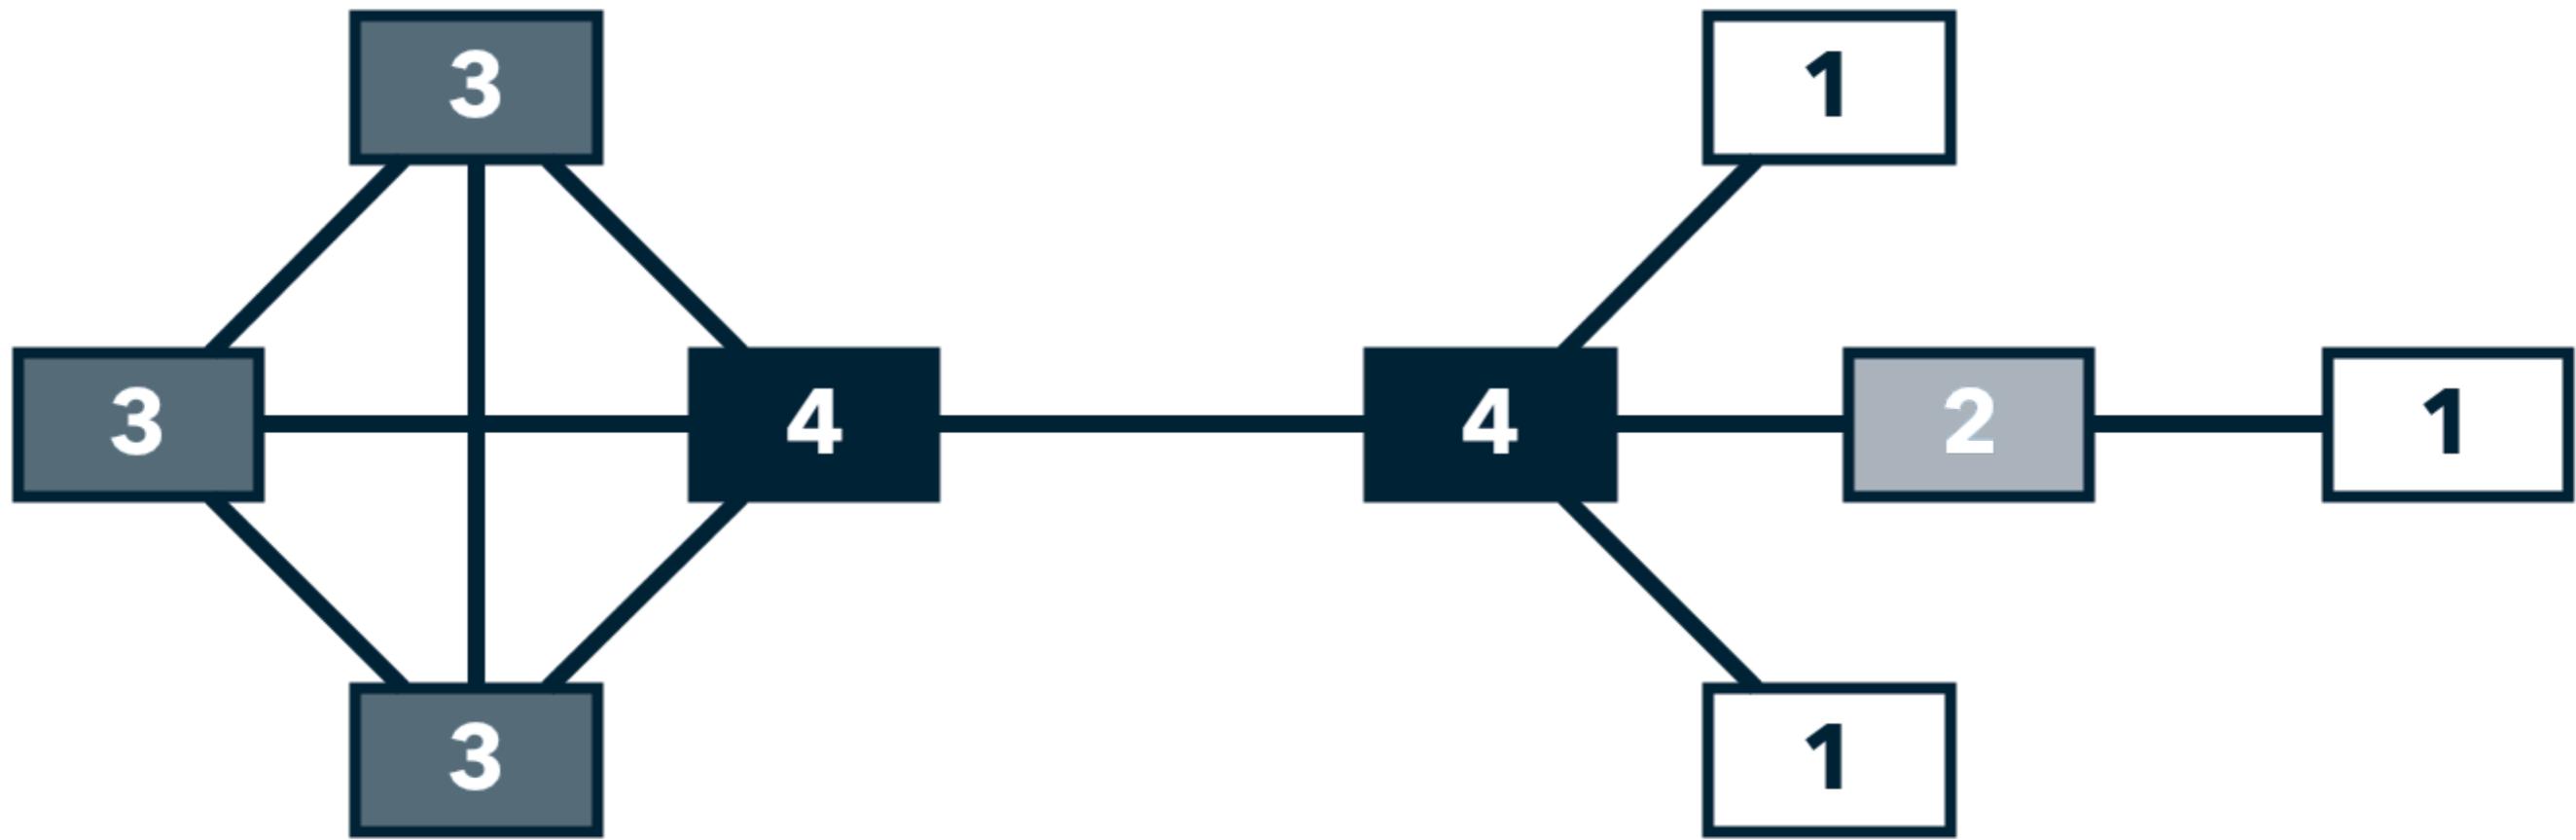

An Artificial Example

Degree Centrality

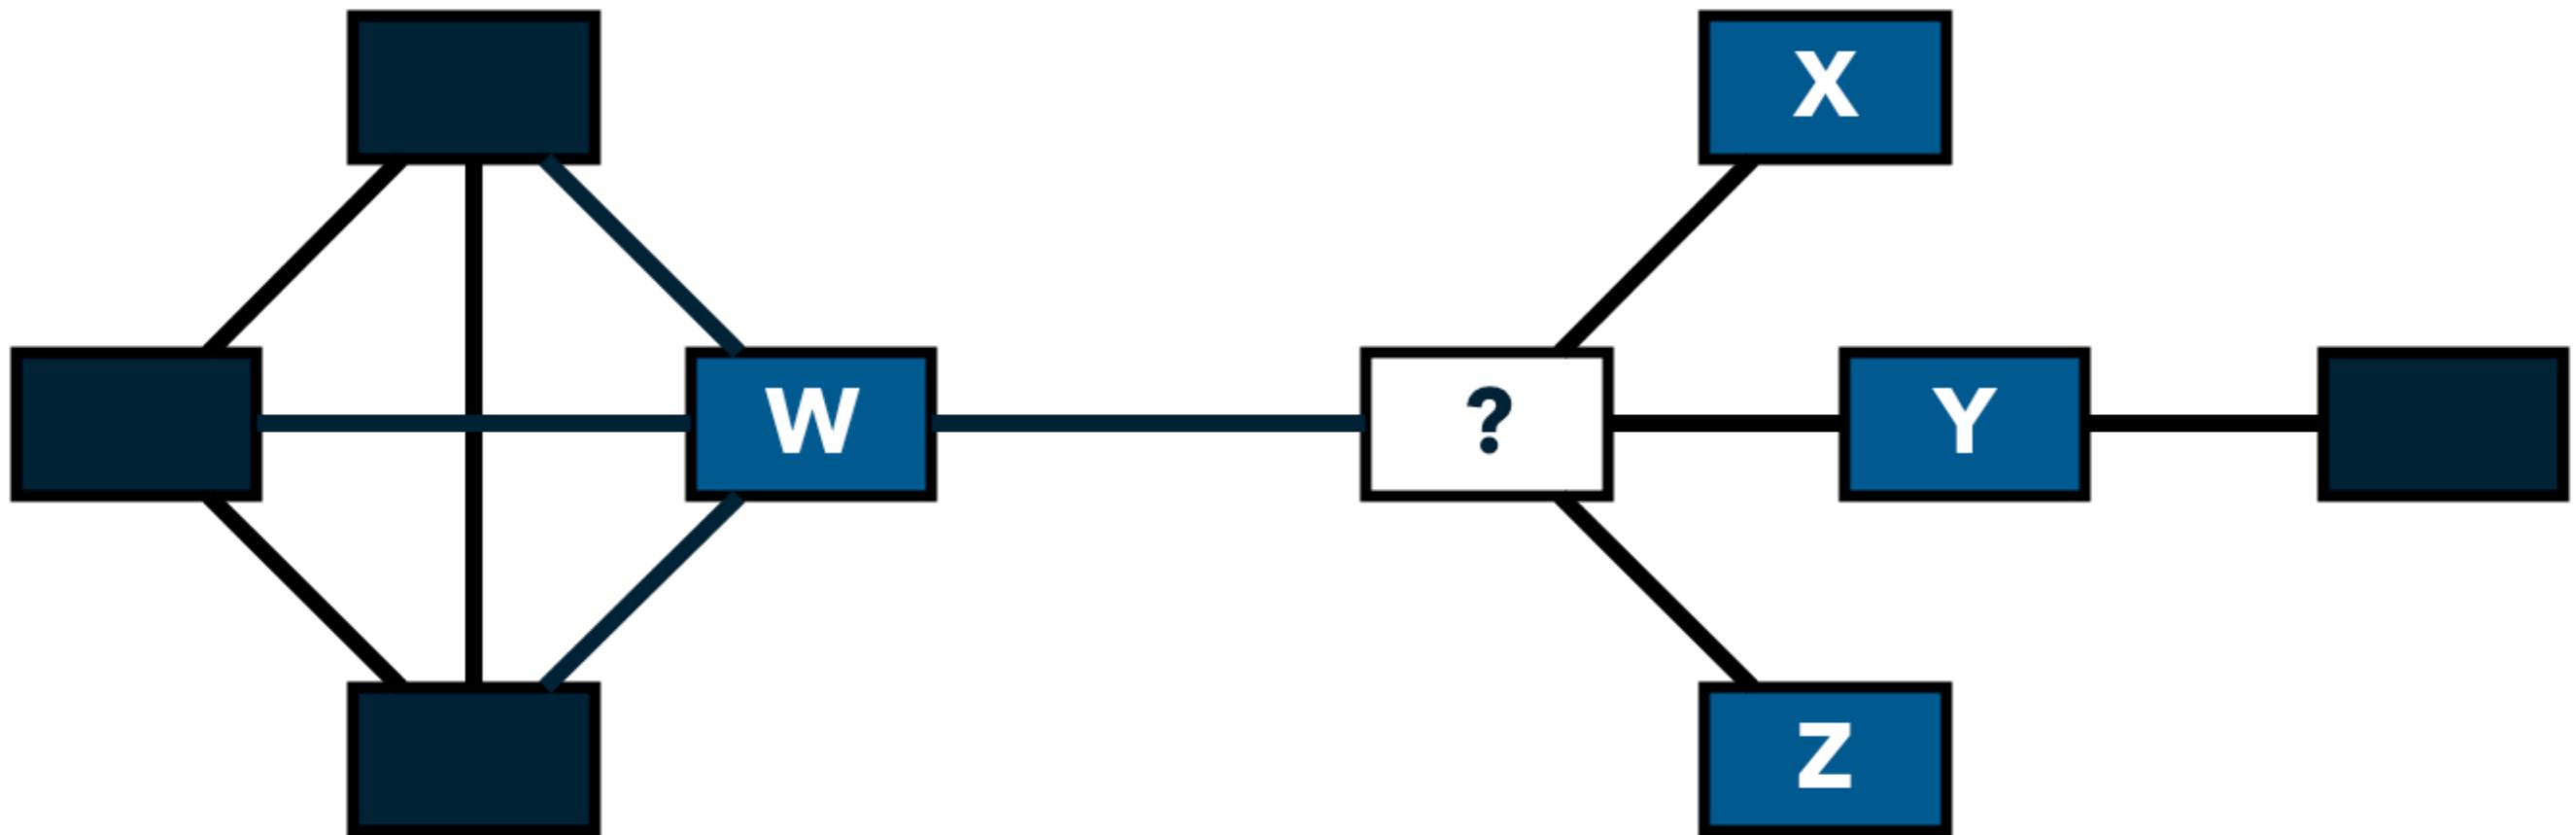

Degree Centrality

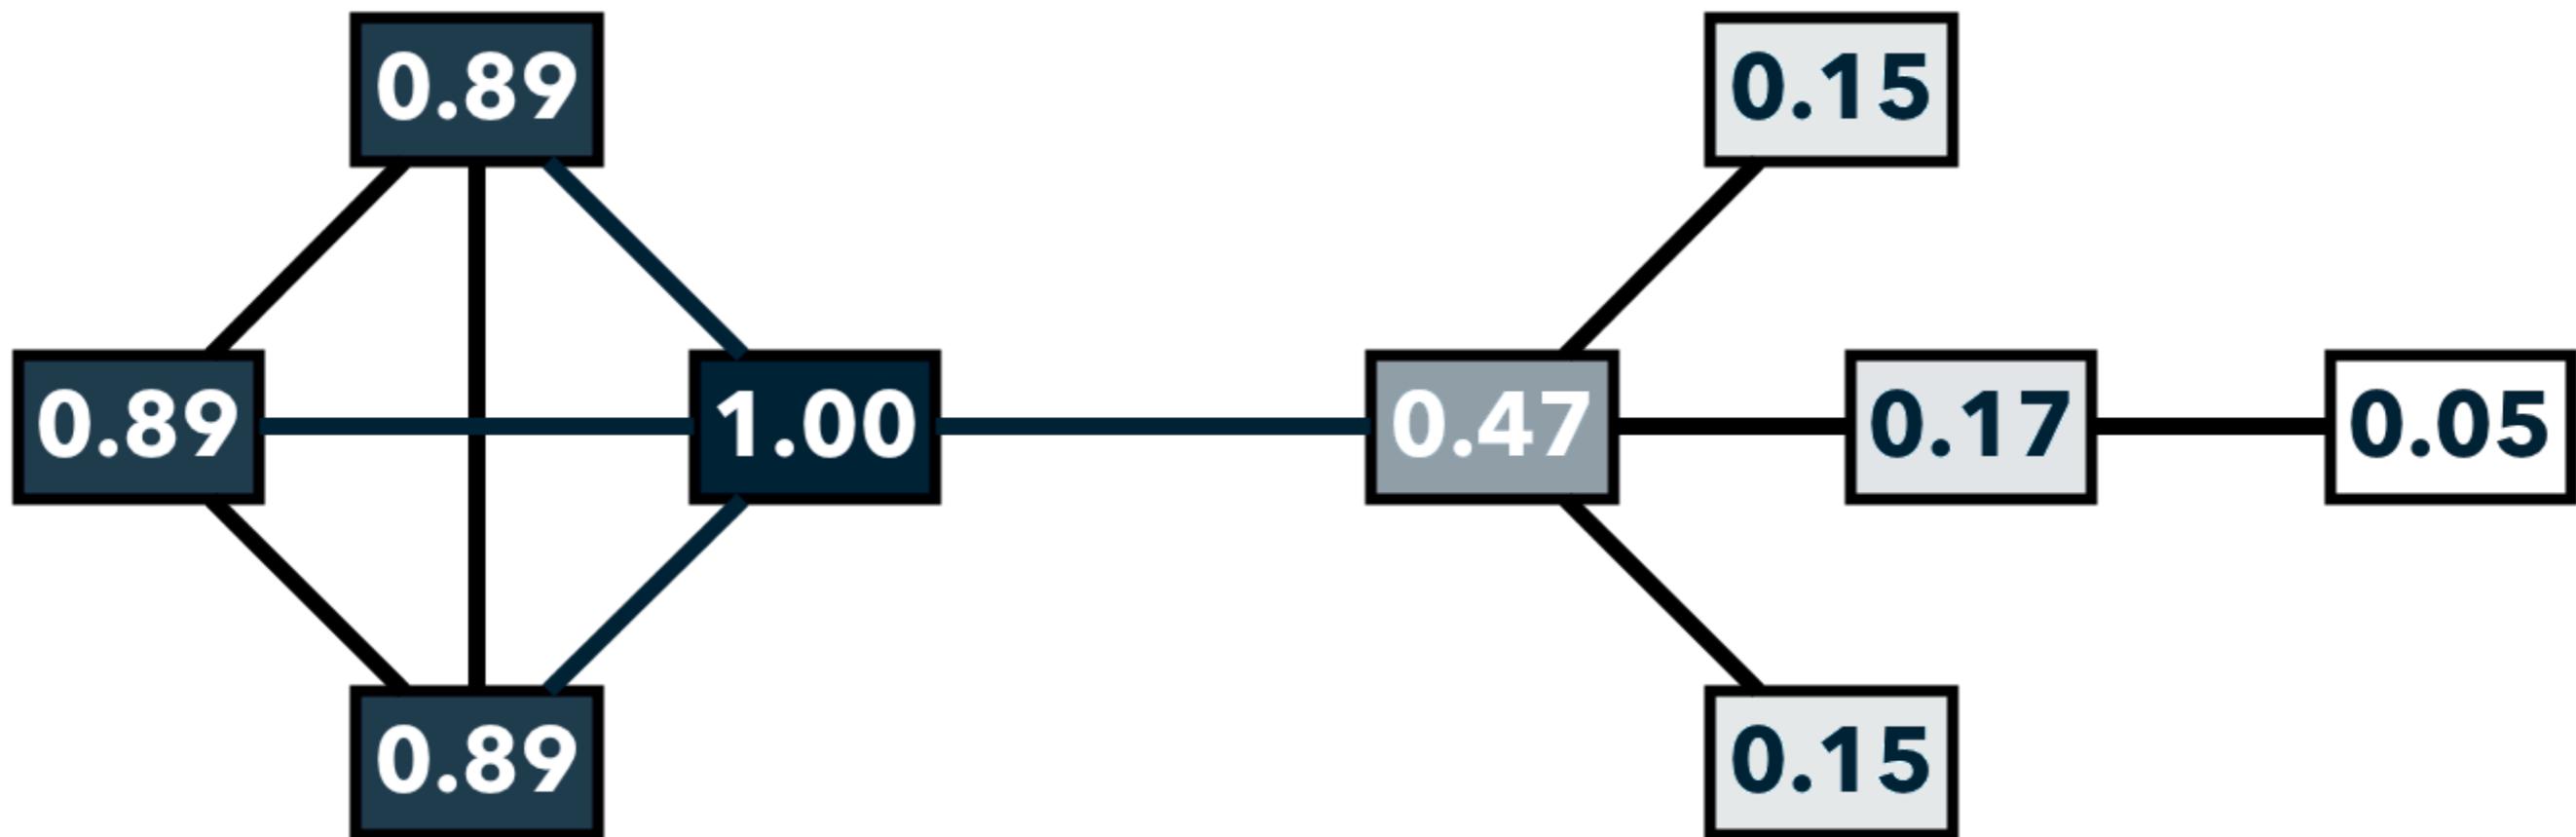

Eigenvector Centrality

$$? = (W + X + Y + Z) / \lambda$$

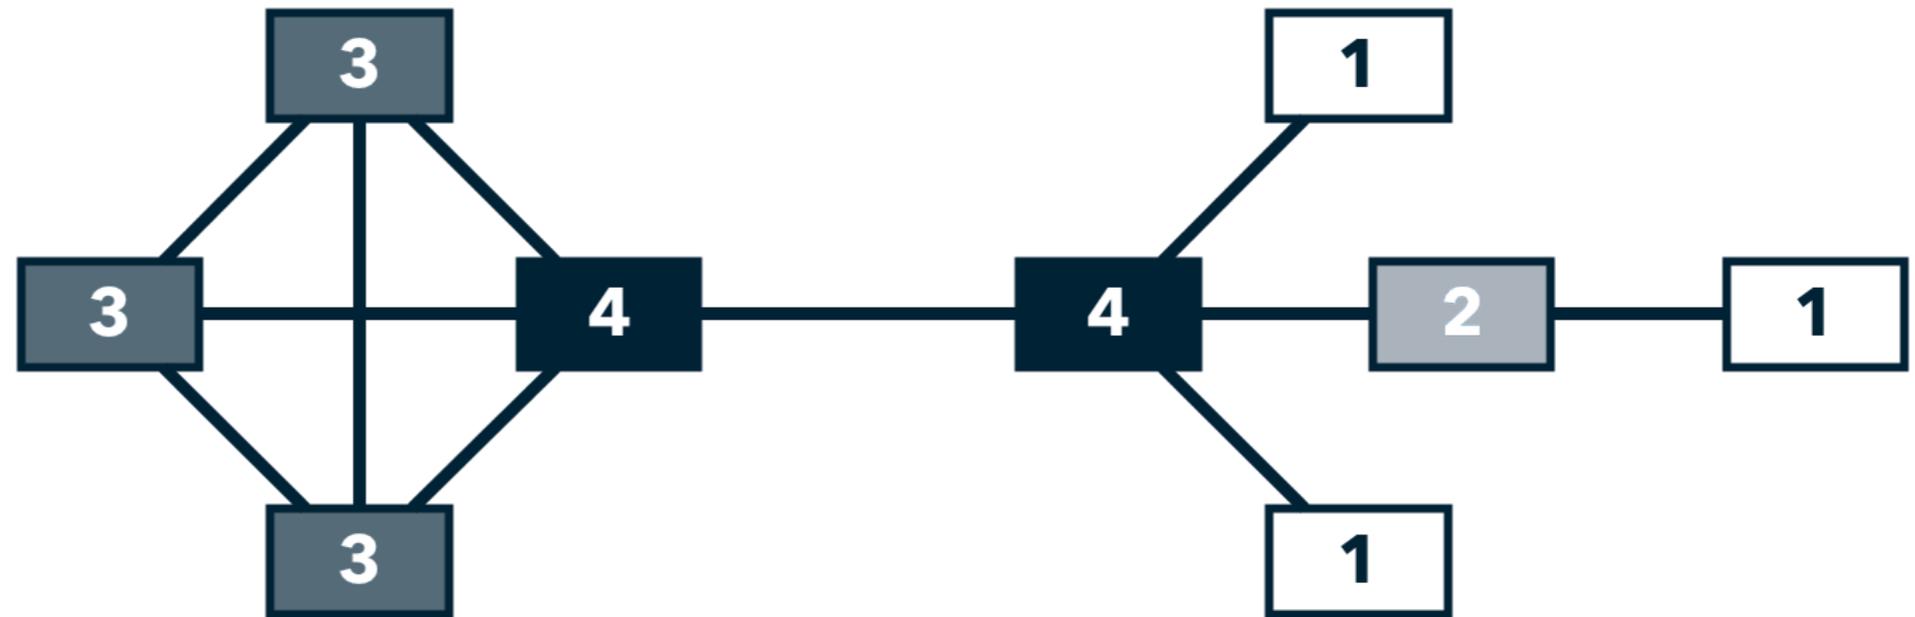

$$C_E(i) = \frac{1}{\lambda} \sum_{j \in N(i)} C_E(j)$$

Eigenvector Centrality

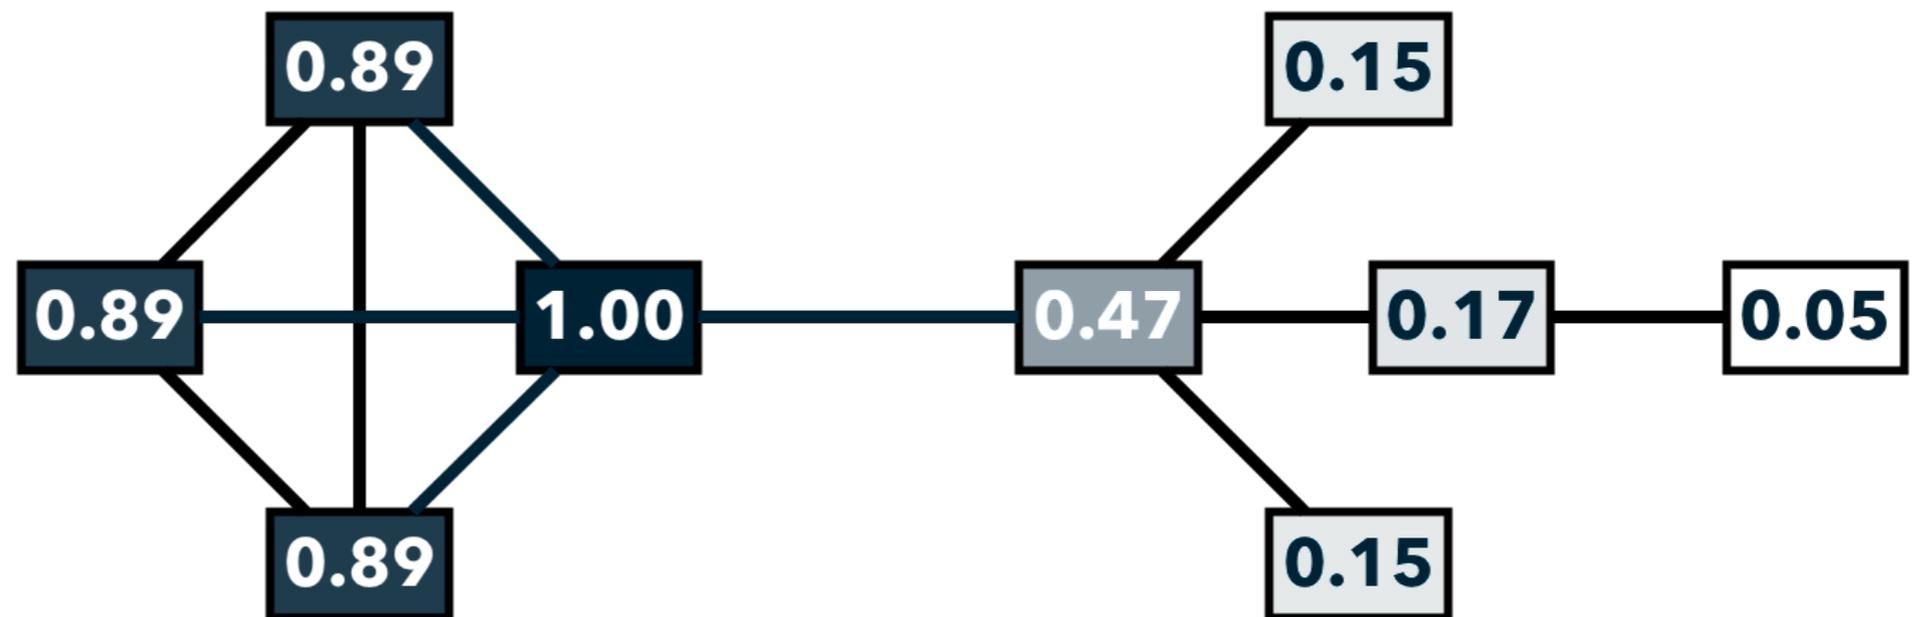

Degree vs eigenvector

Degree

Eigenvector

Dolphins

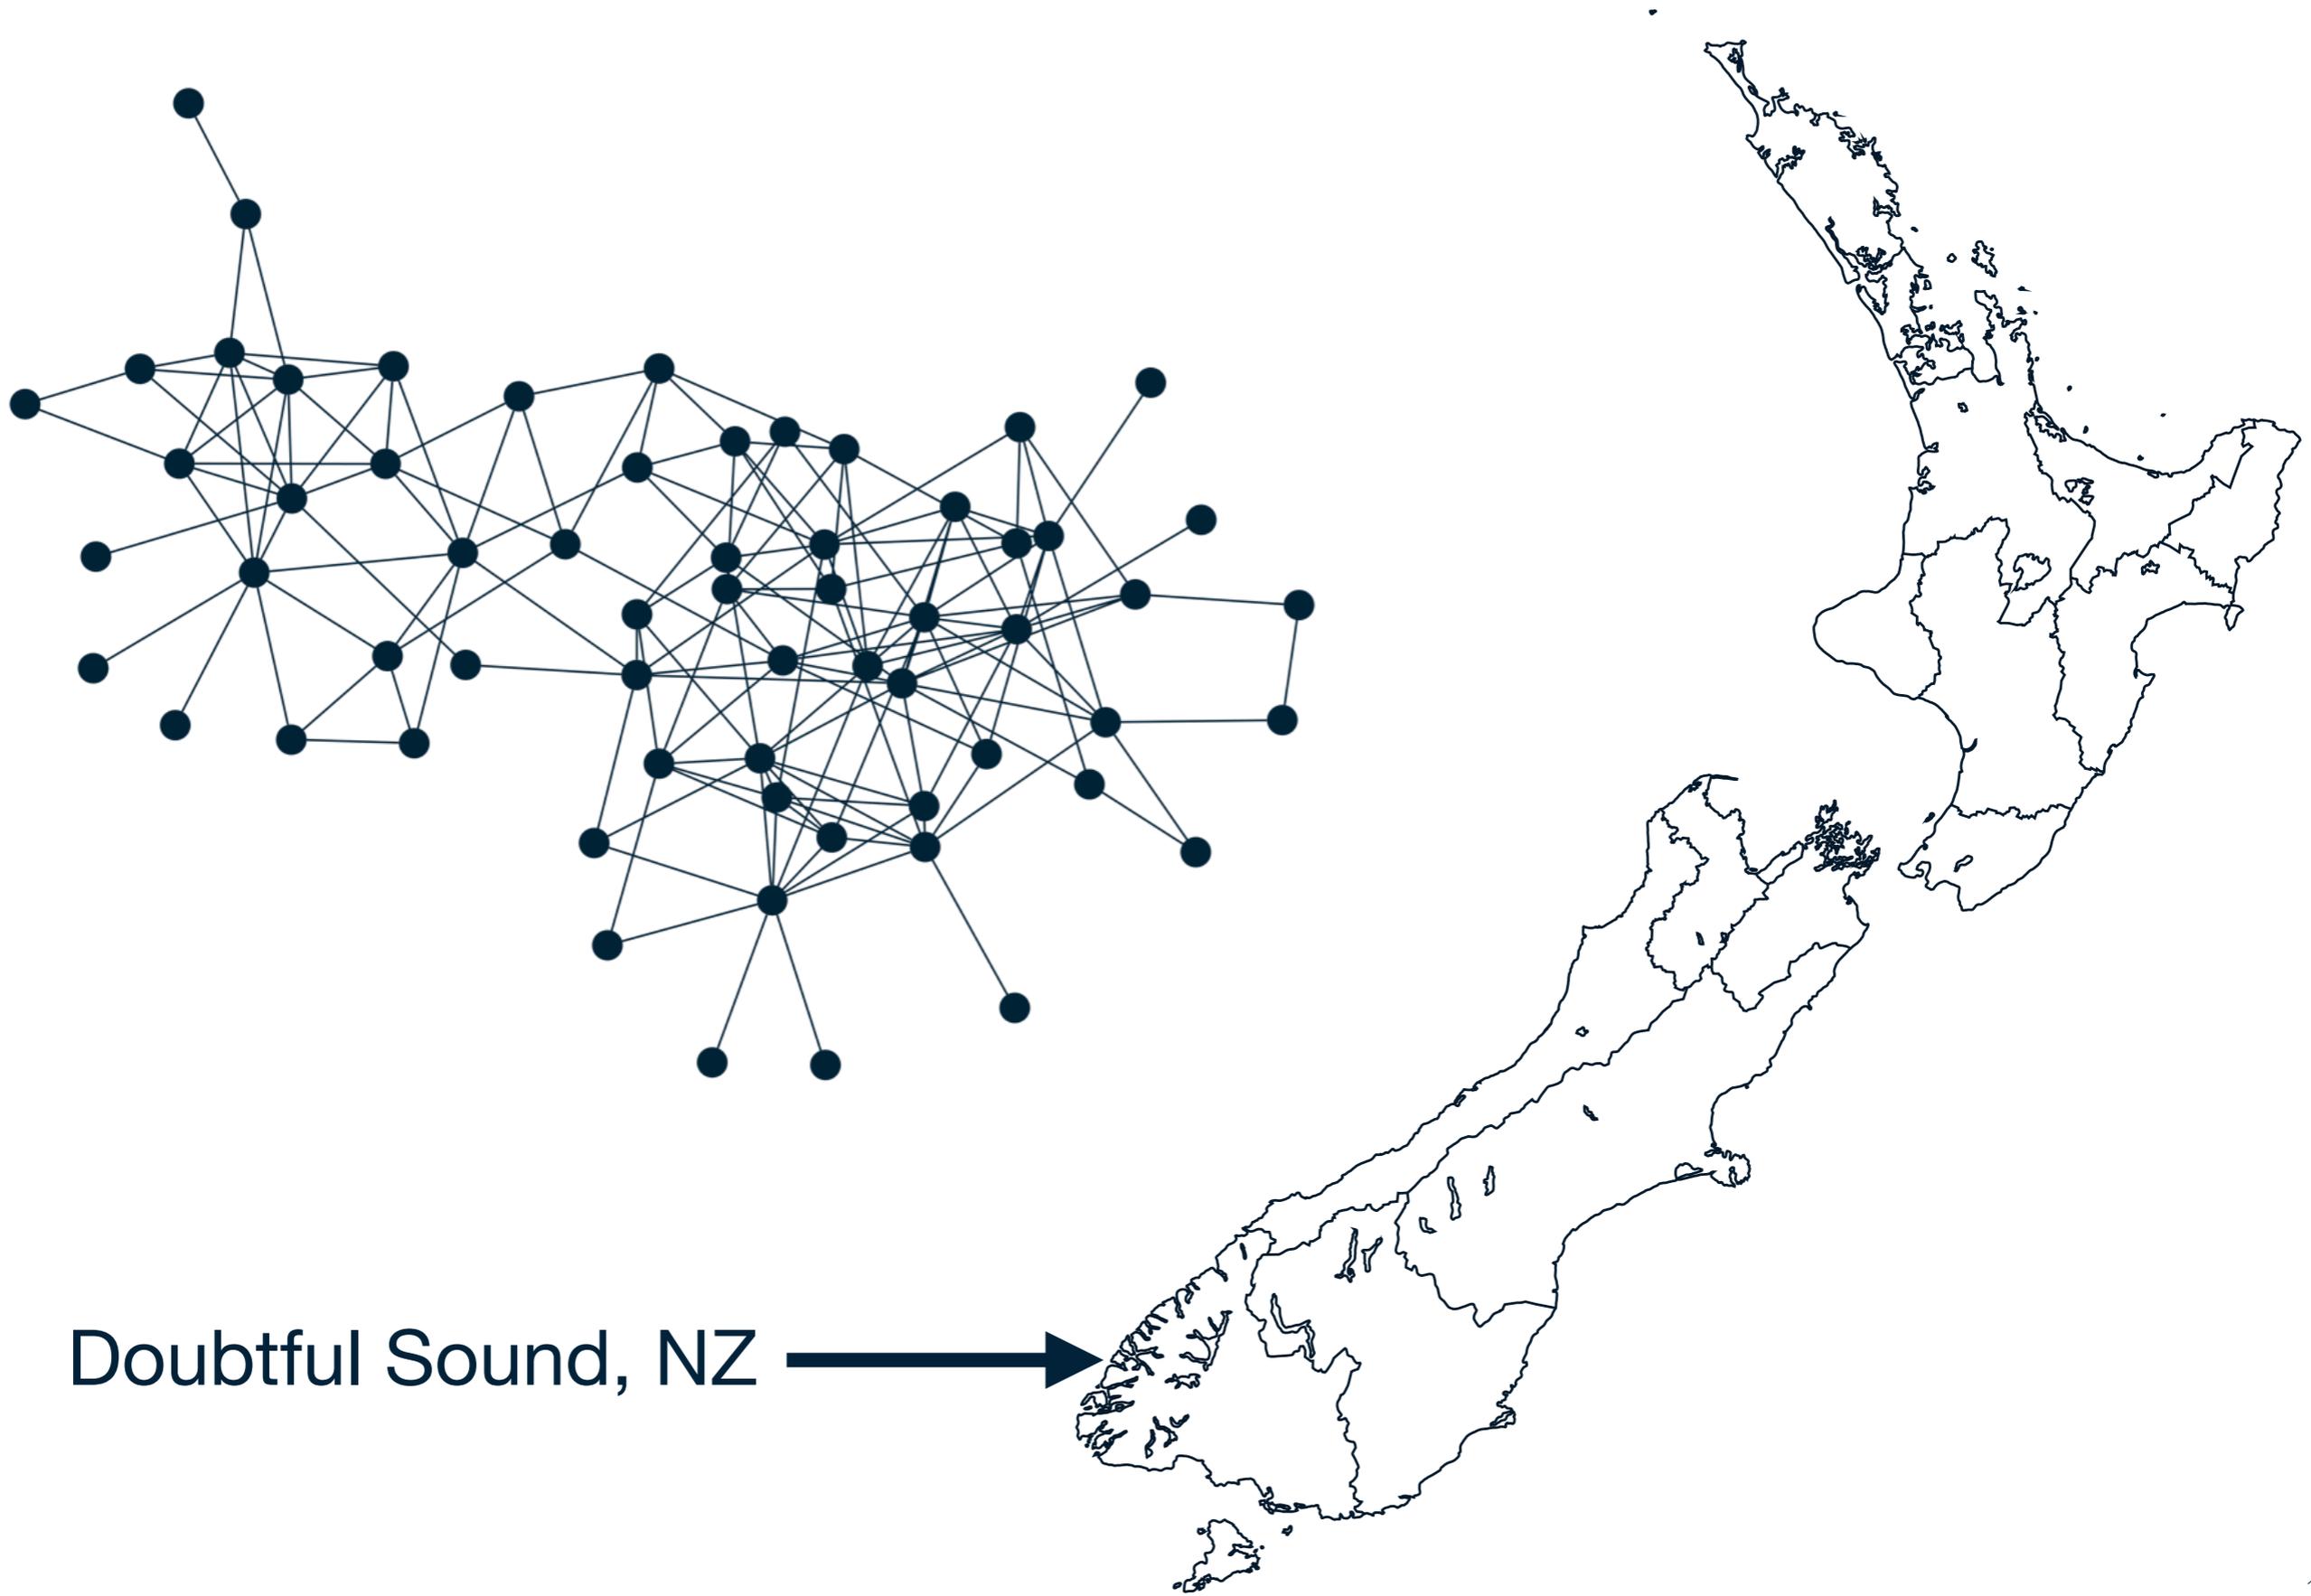

Lusseau, David, Karsten Schneider, Oliver J. Boisseau, Patti Haase, Elisabeth Slooten, and Steve M. Dawson. 2003. "The Bottlenose Dolphin Community of Doubtful Sound Features a Large Proportion of Long-Lasting Associations." *Behavioral Ecology and Sociobiology* 54 (4) (September 1): 396–405.

Eigenvector Centrality

Eigenvector Centrality

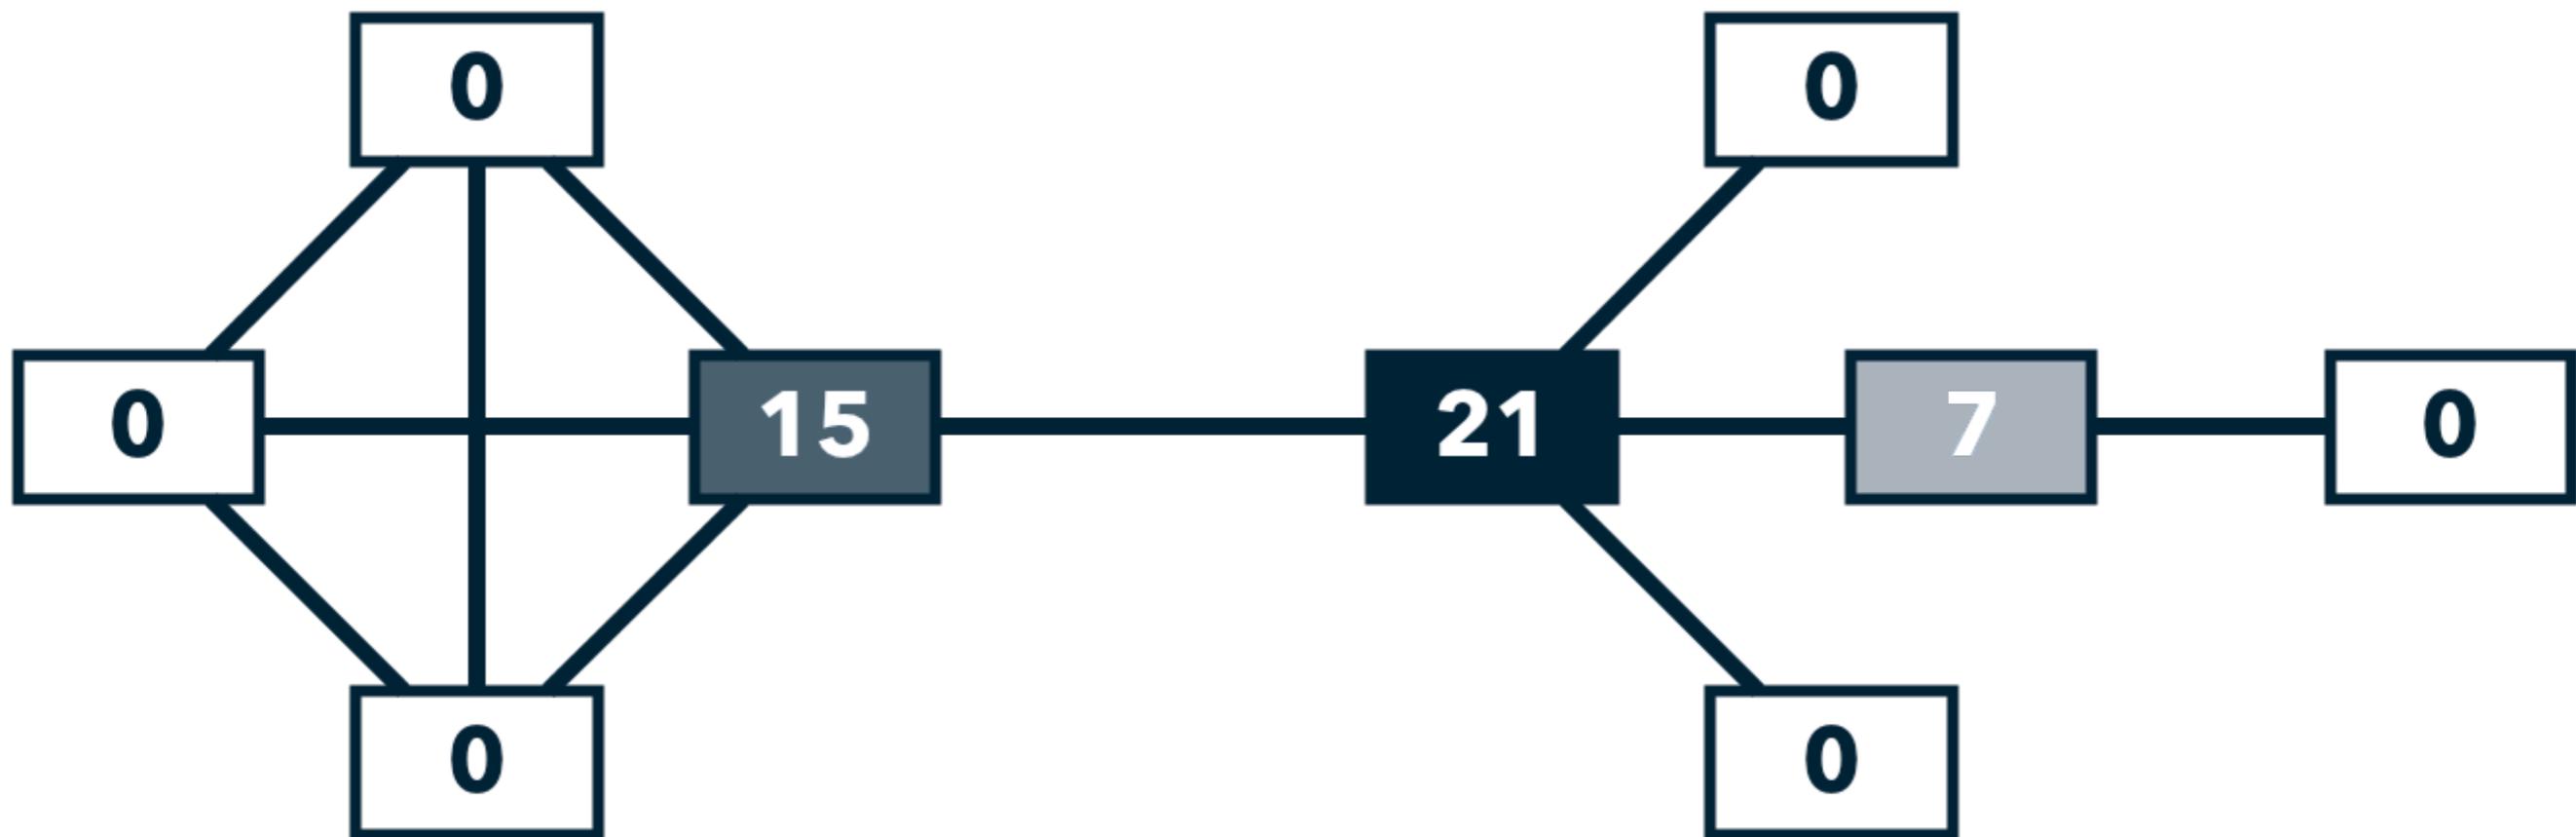

Betweenness Centrality

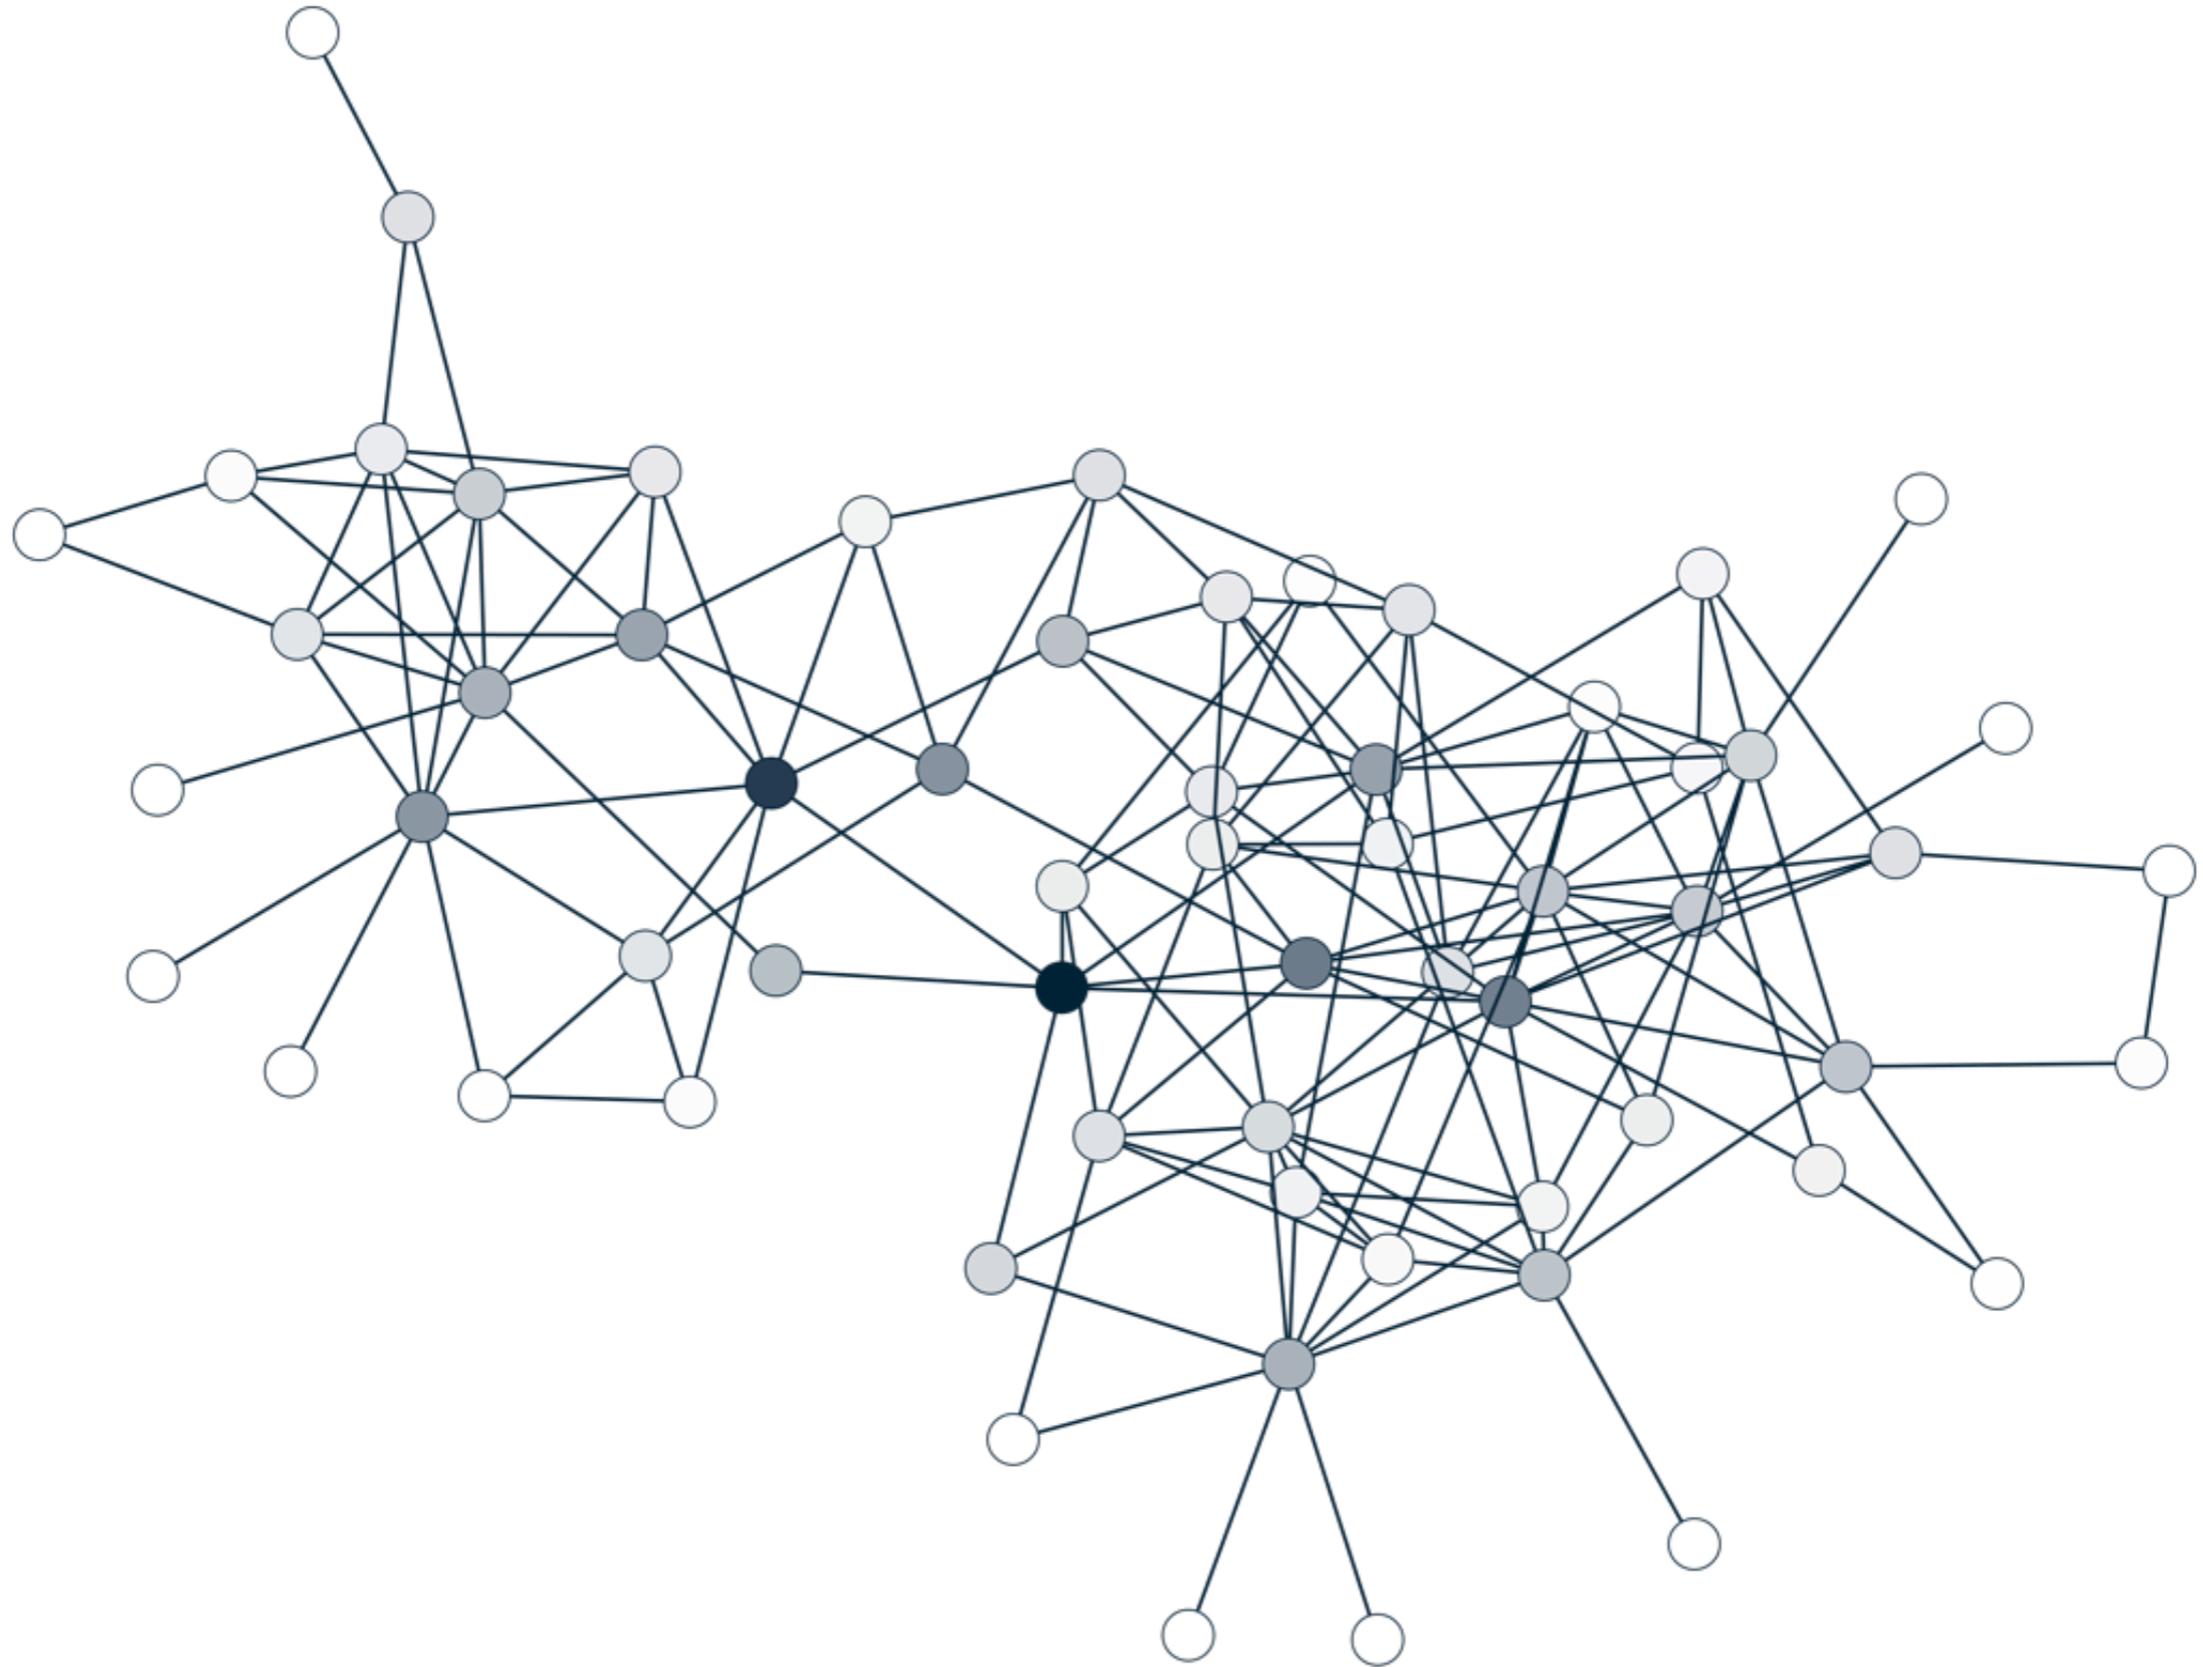

*Shortest path
(geodesic) from
S to T*

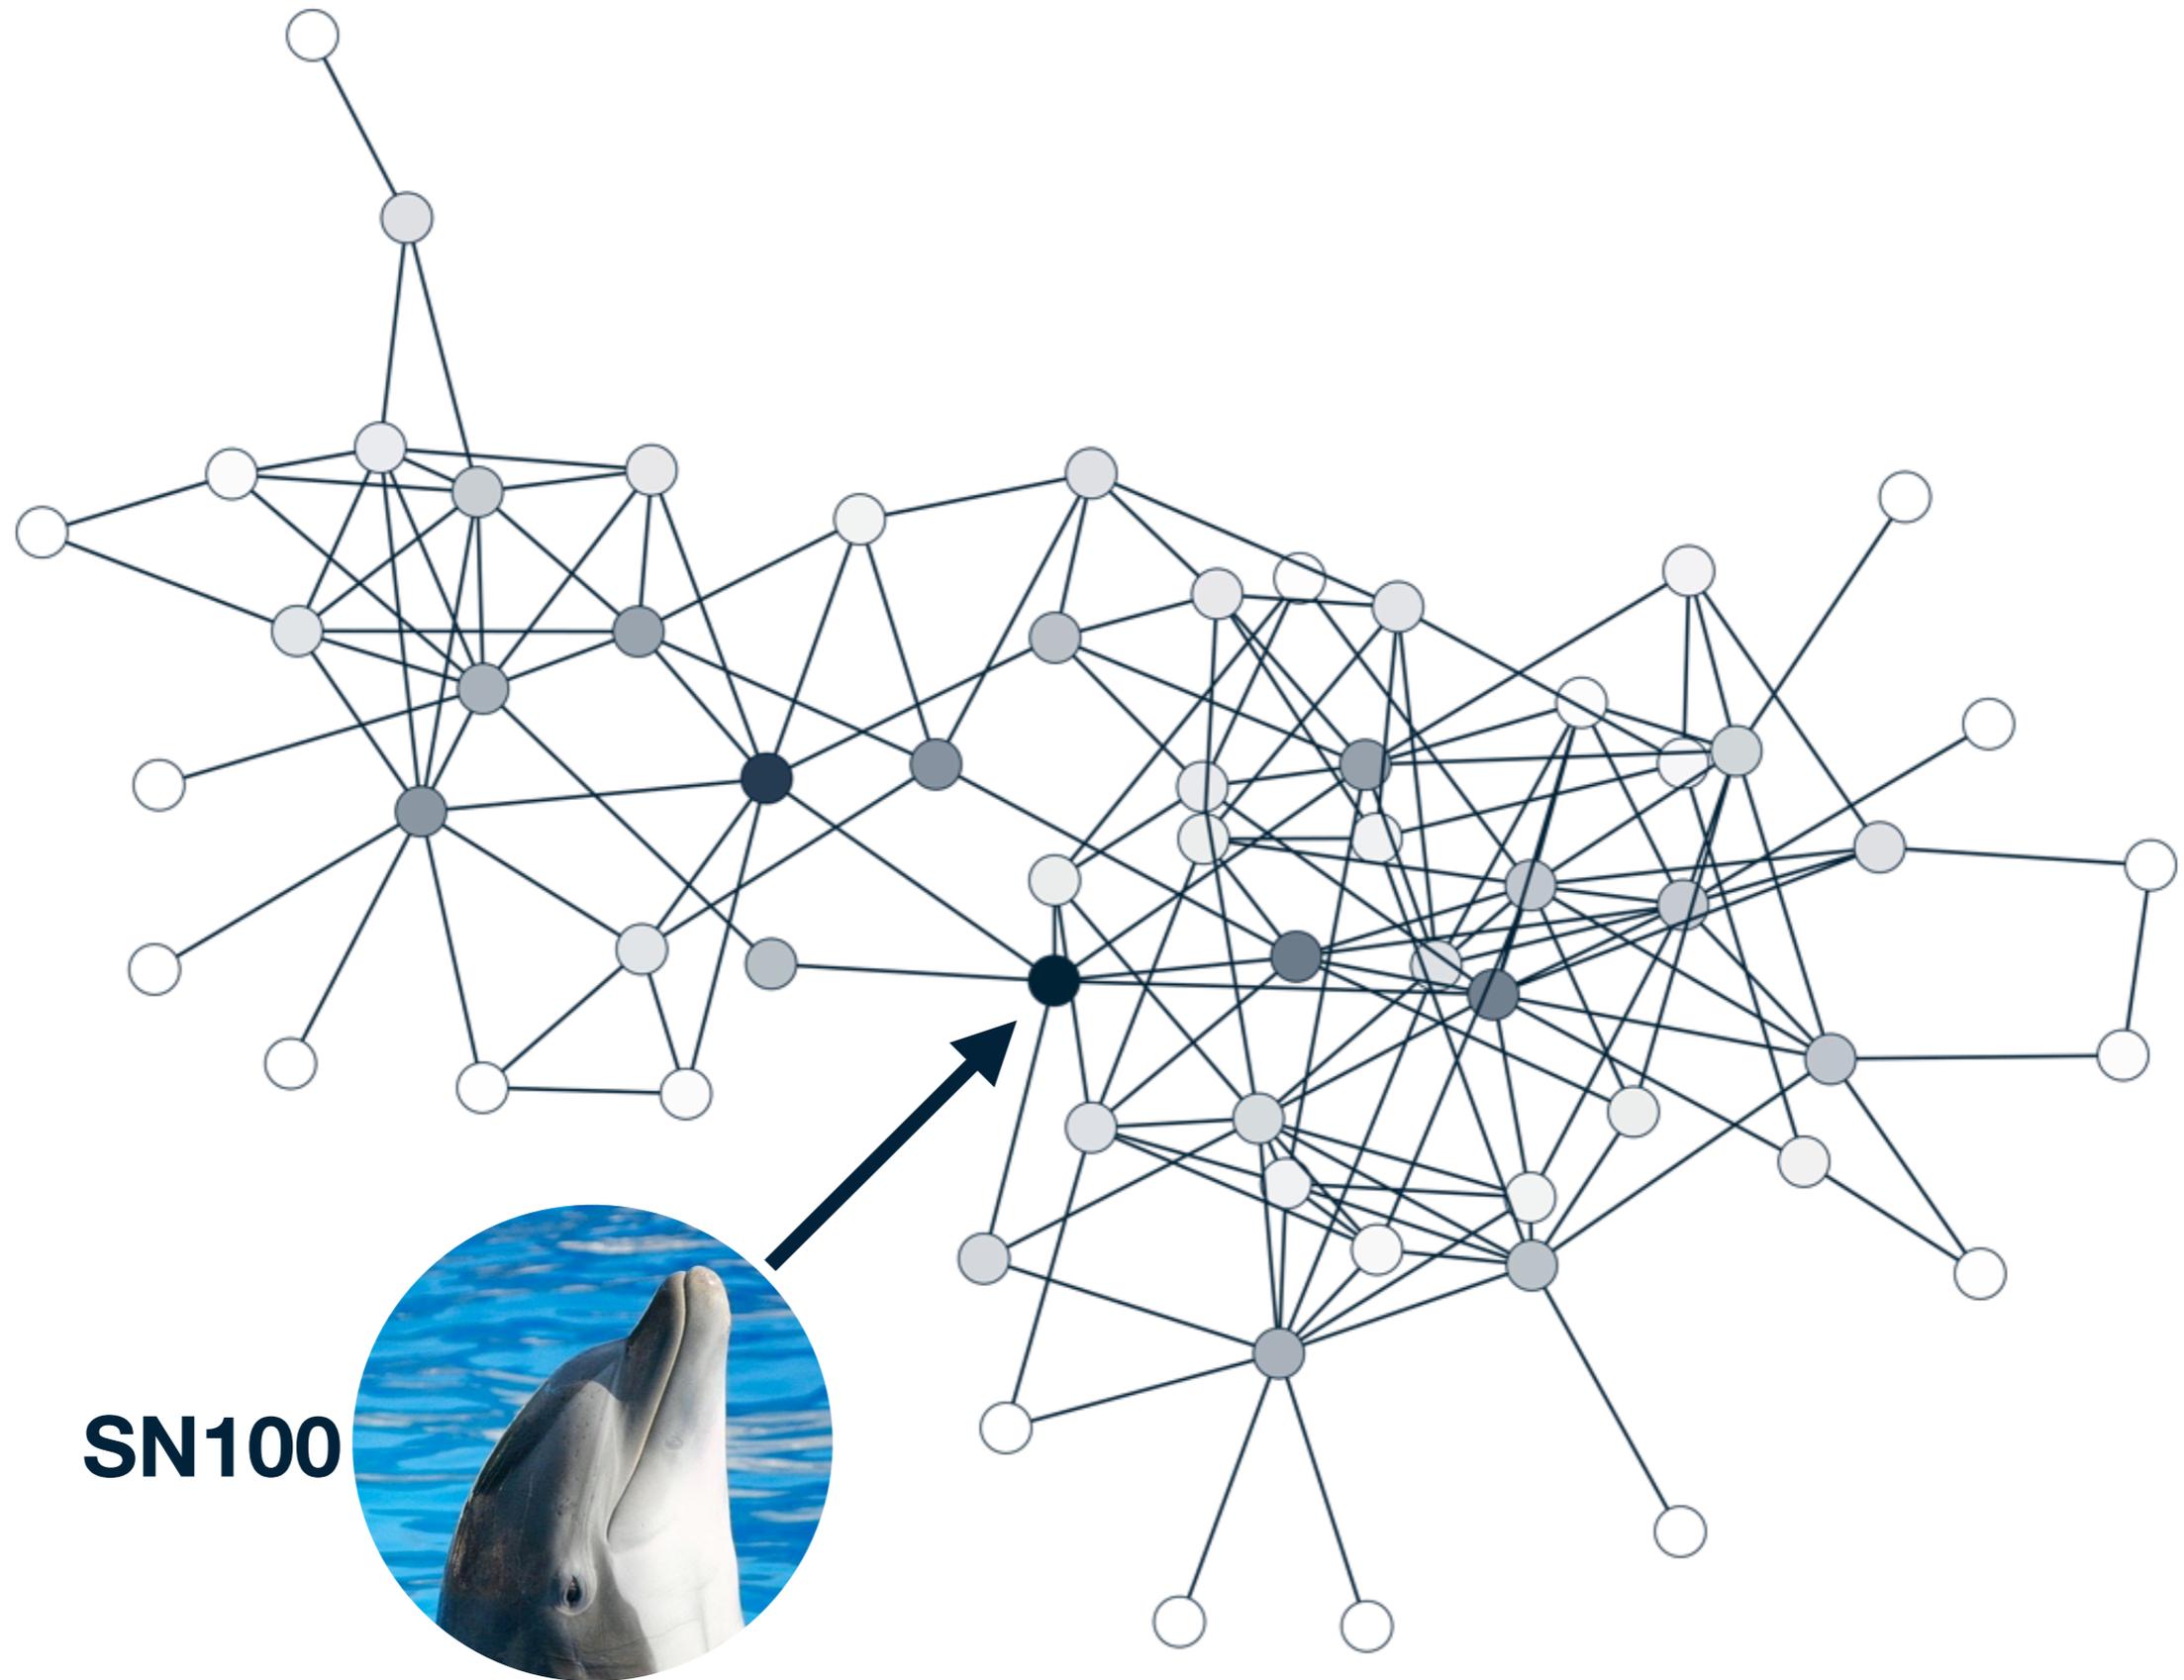

Betweenness Centrality

Betweenness Centrality

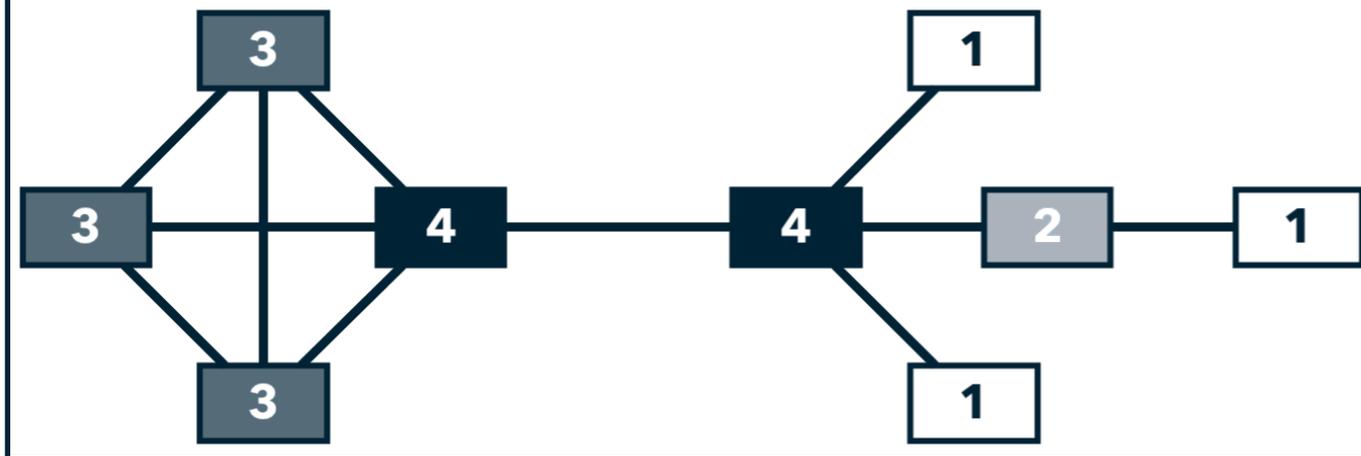

Betweenness Centrality

SN100

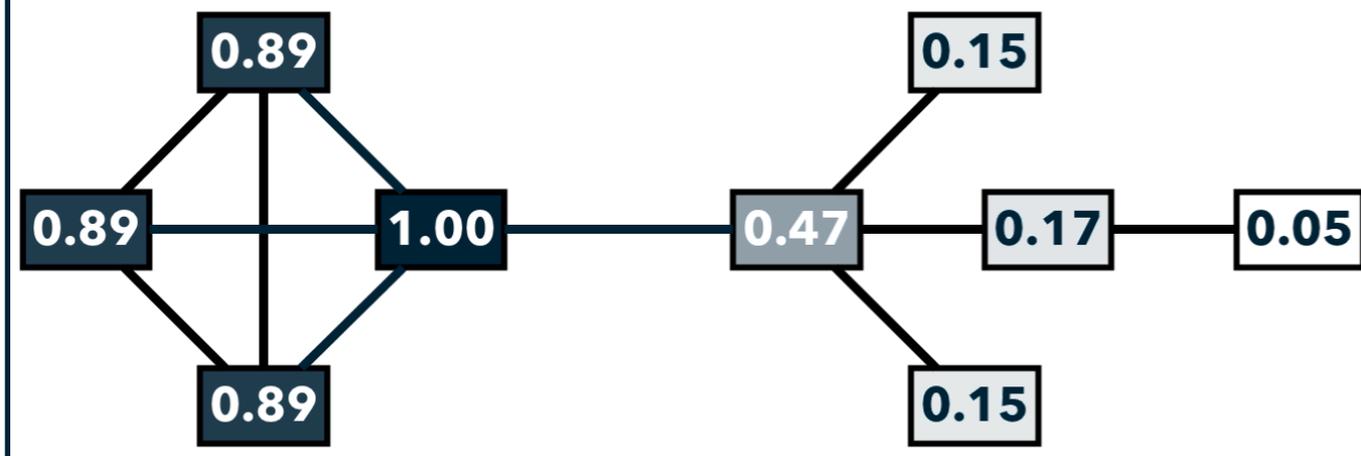

Comparison

Degree

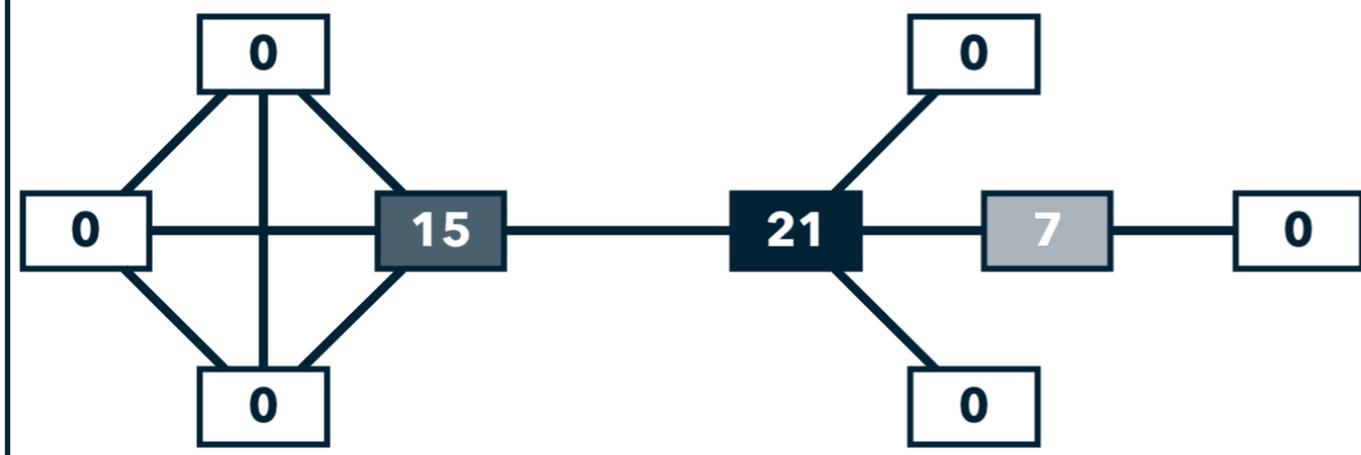

connected to many other vertices

Eigenvector

connected to many other *well connected* vertices

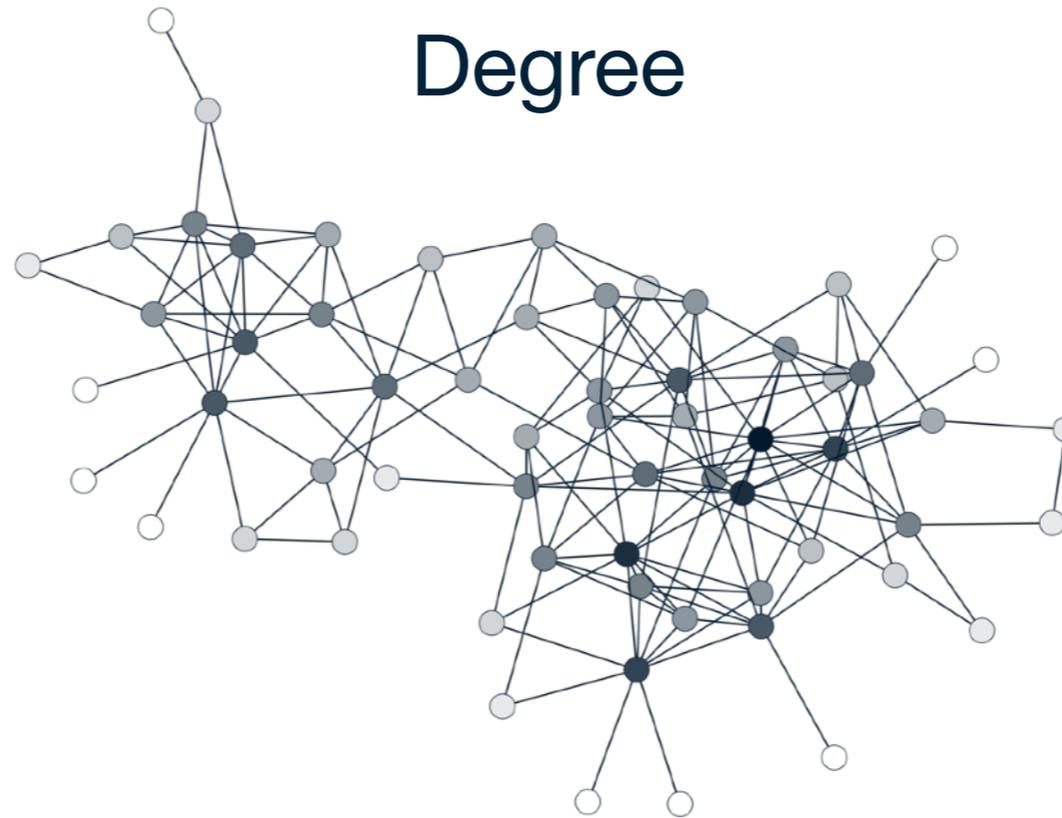

Betweenness

on the shortest path connecting many pairs of vertices

Comparison

Degree

Eigenvector

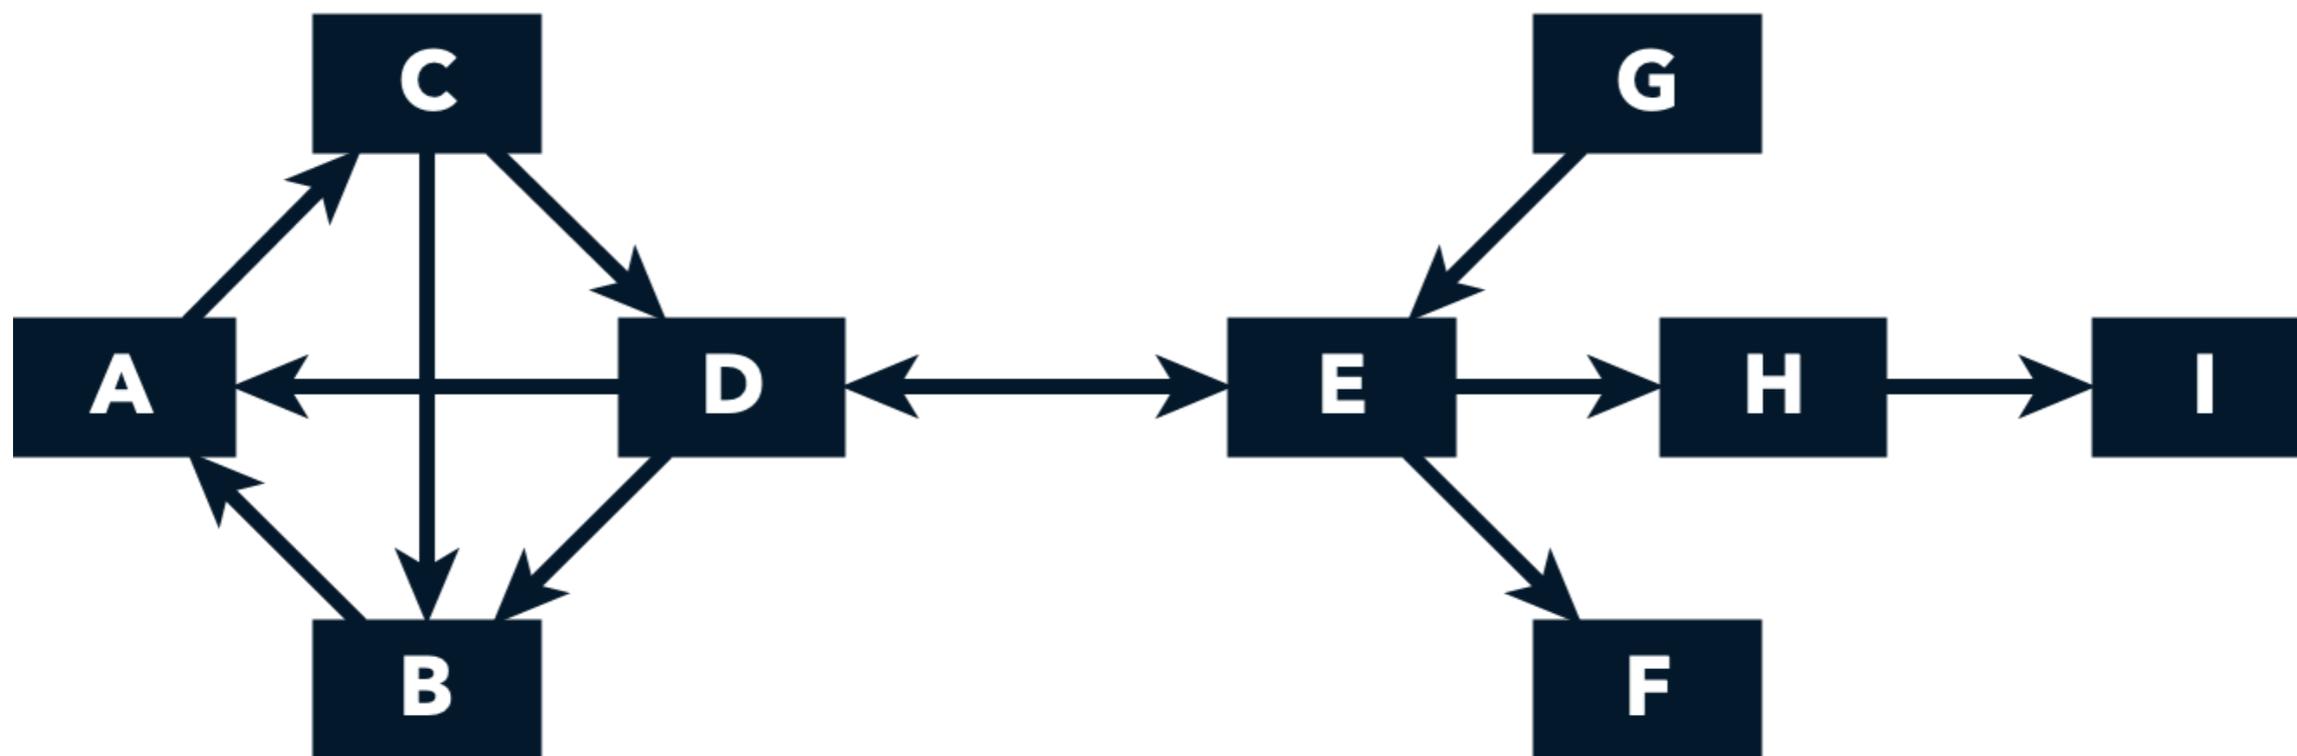

Betweenness

Complications: directed edges and weights

Directed edges

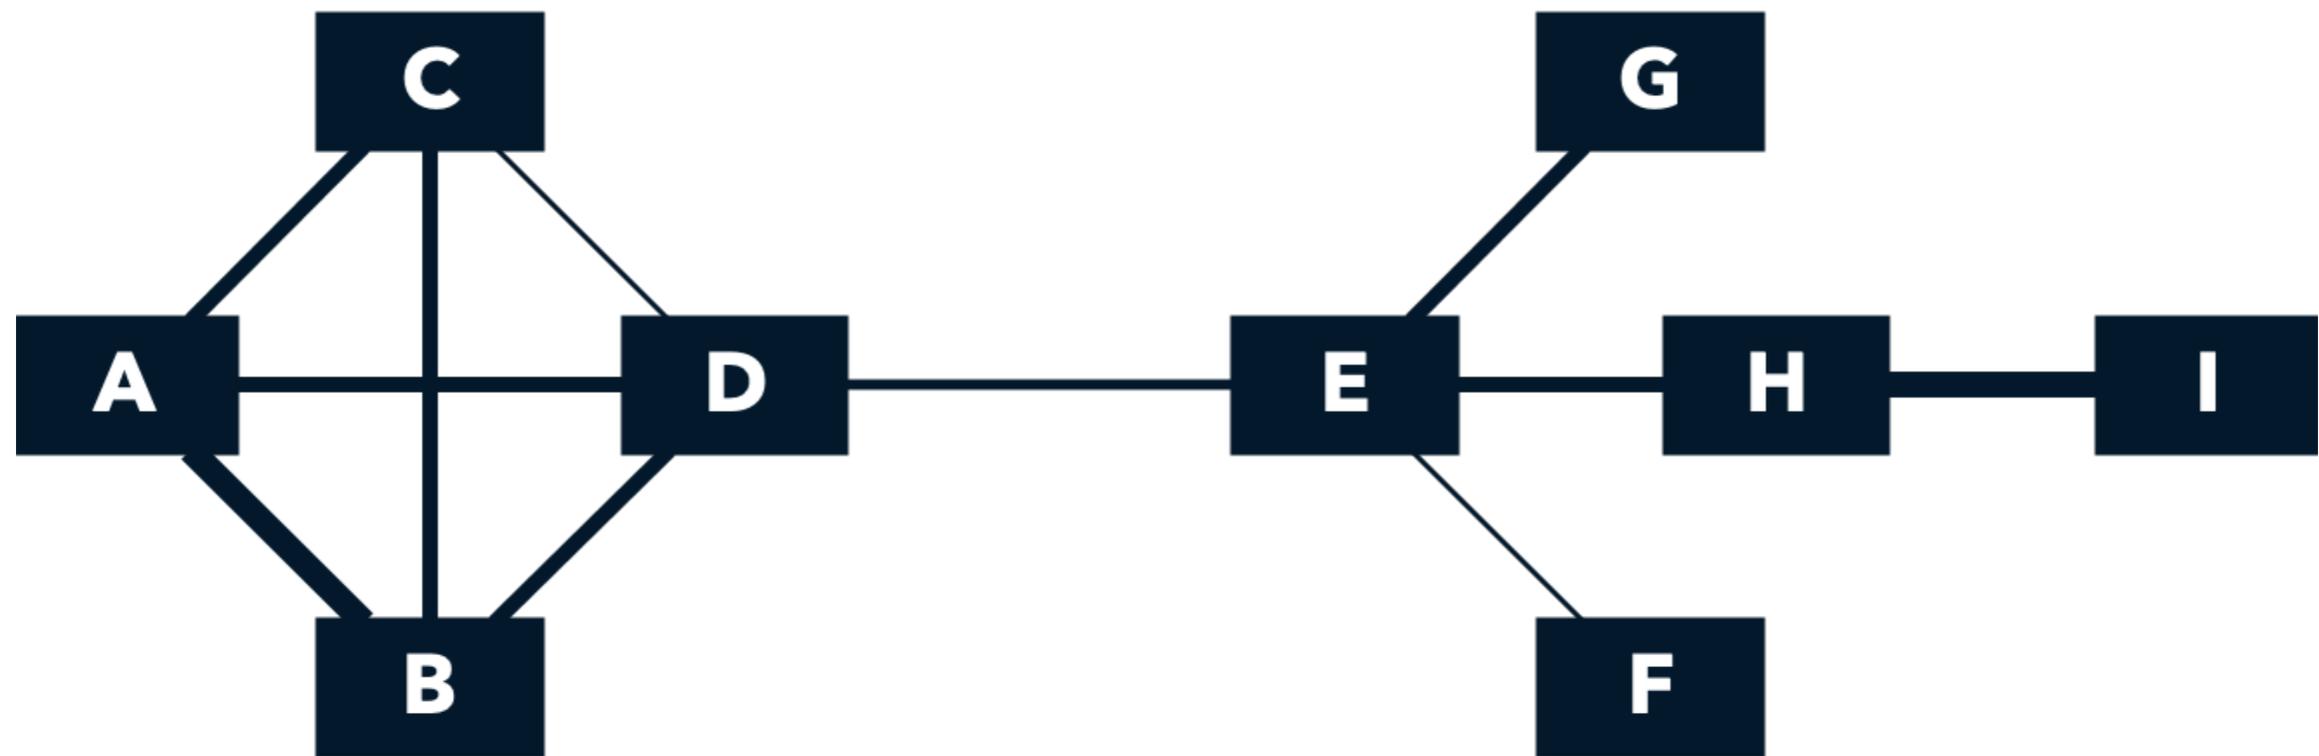

Directed edges affect *degree*

- ∴ *In-degree*: number of edges coming into a node
- ∴ *Out-degree*: number of edges coming out of a node
- ∴ **Note**: *eigenvector centrality on directed networks focusses on in-degree.*

Directed edges affect *paths*

- ∴ Paths follow edge directions
- ∴ Path from B to E is longer than the path from E to B

Edge weights

Edge weights affect *degree*

- ∴ Often want stronger edges contribute more to degree
- ∴ Node with a few strong relations can have the same “degree” as a node with many weak relations

Edge weights affect *paths*

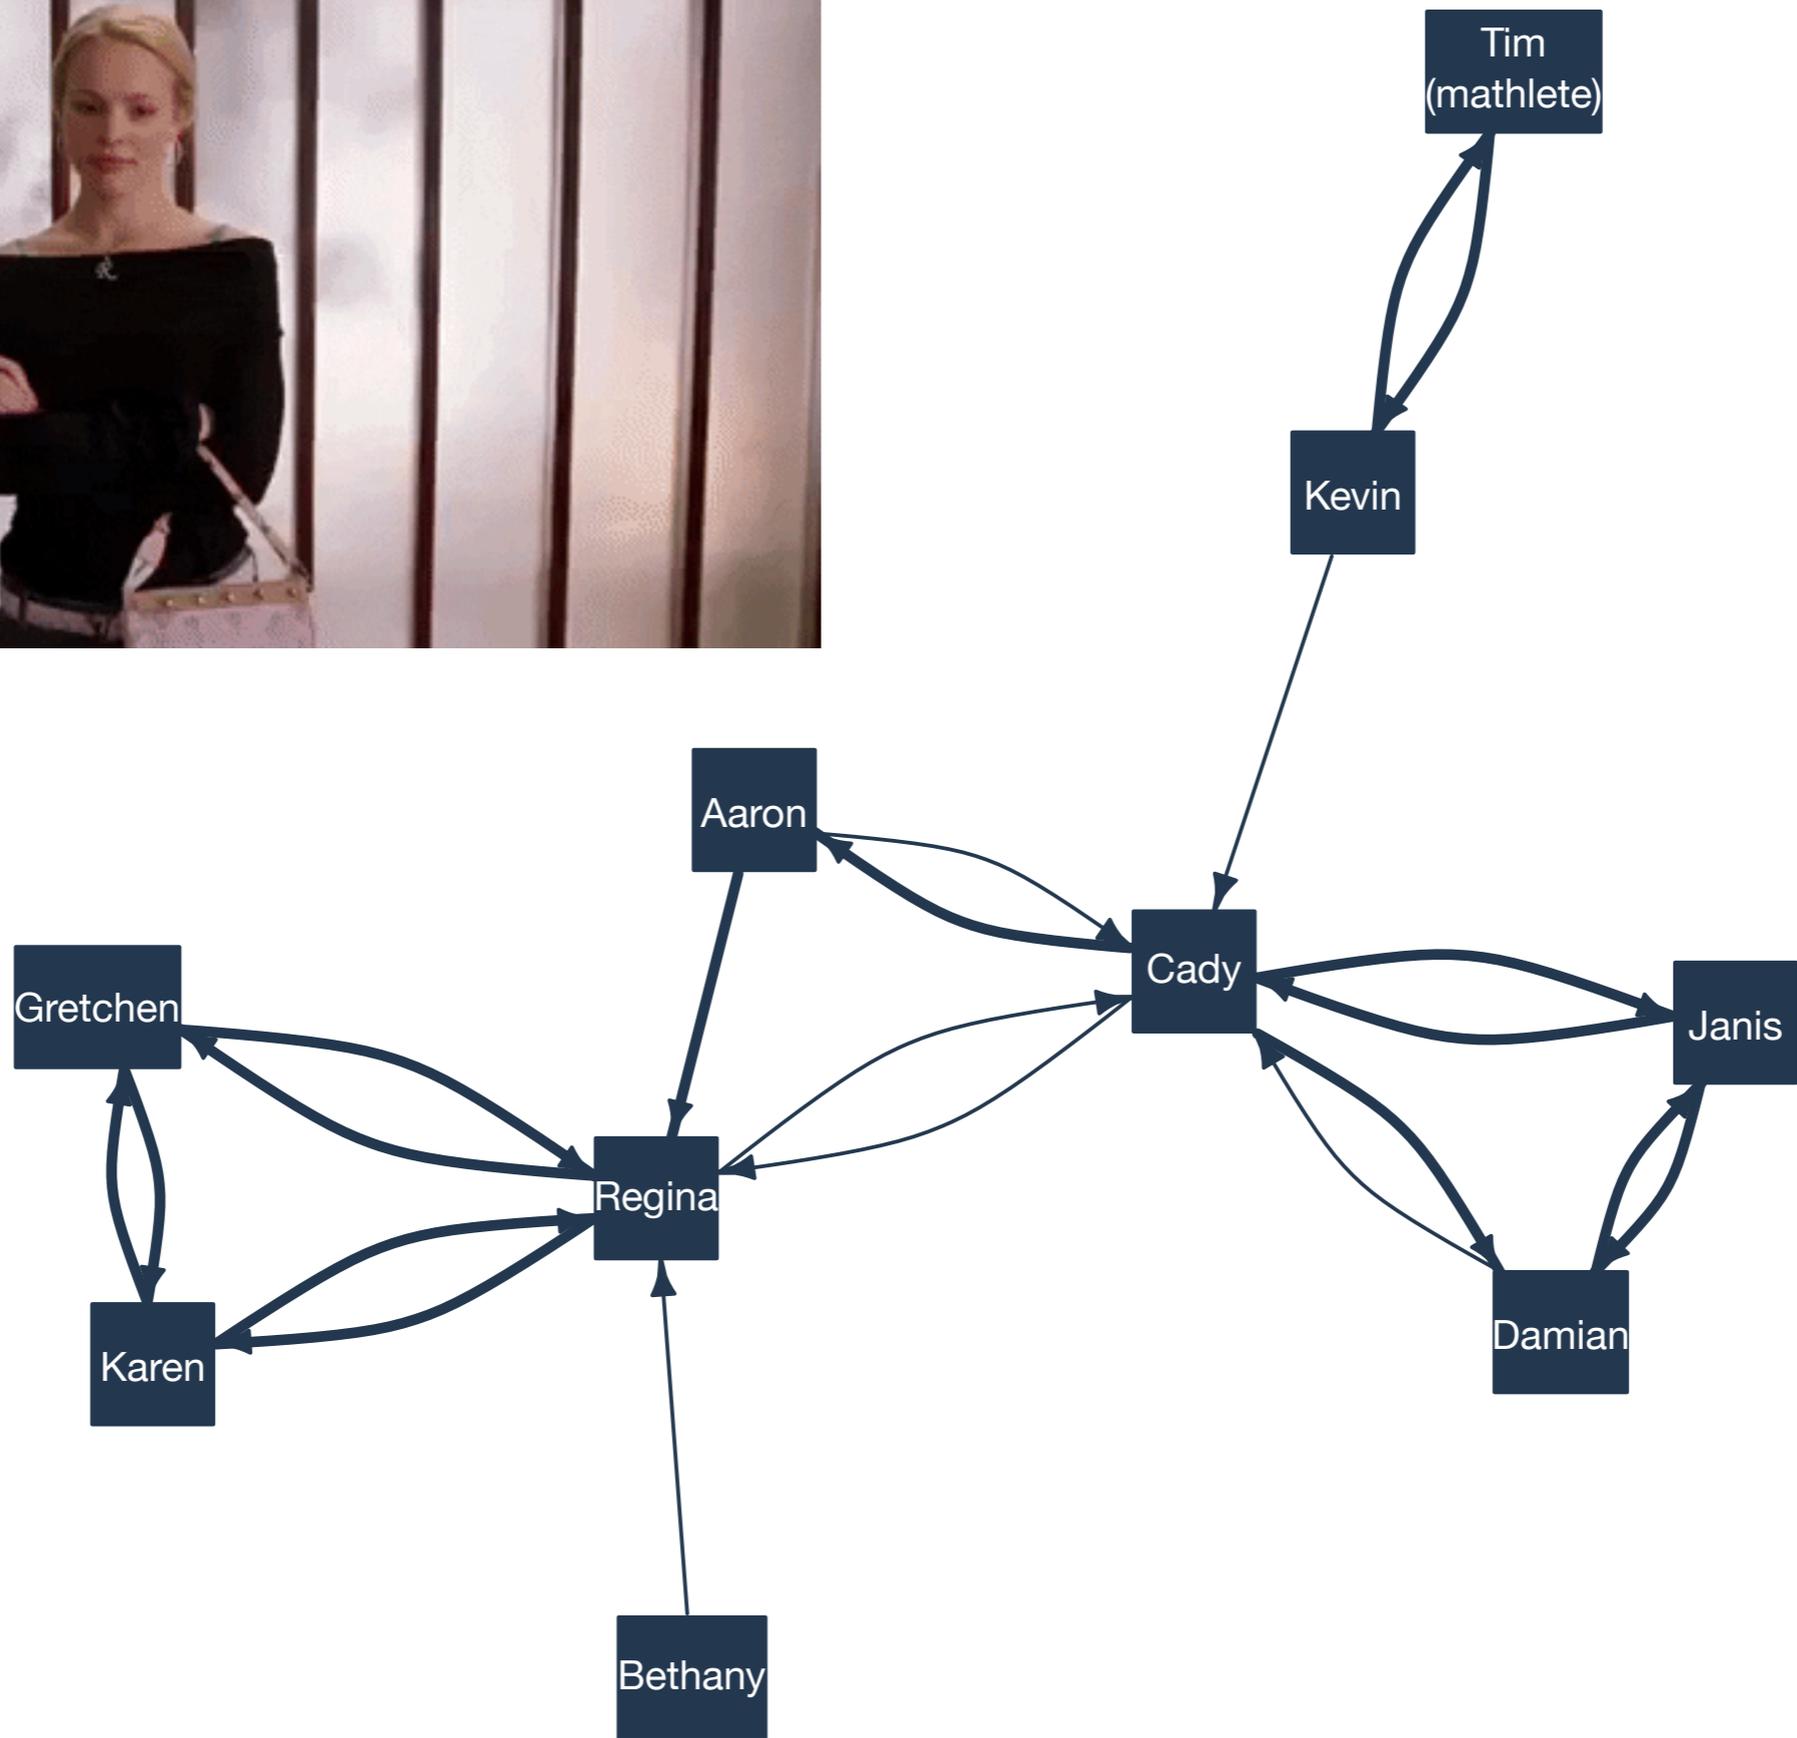

- ∴ Edge width affects the ‘distance’ or ‘flow’ between nodes
- ∴ Large weights \Leftrightarrow long paths?
- ∴ Large weights \Leftrightarrow wide pipes?

Example

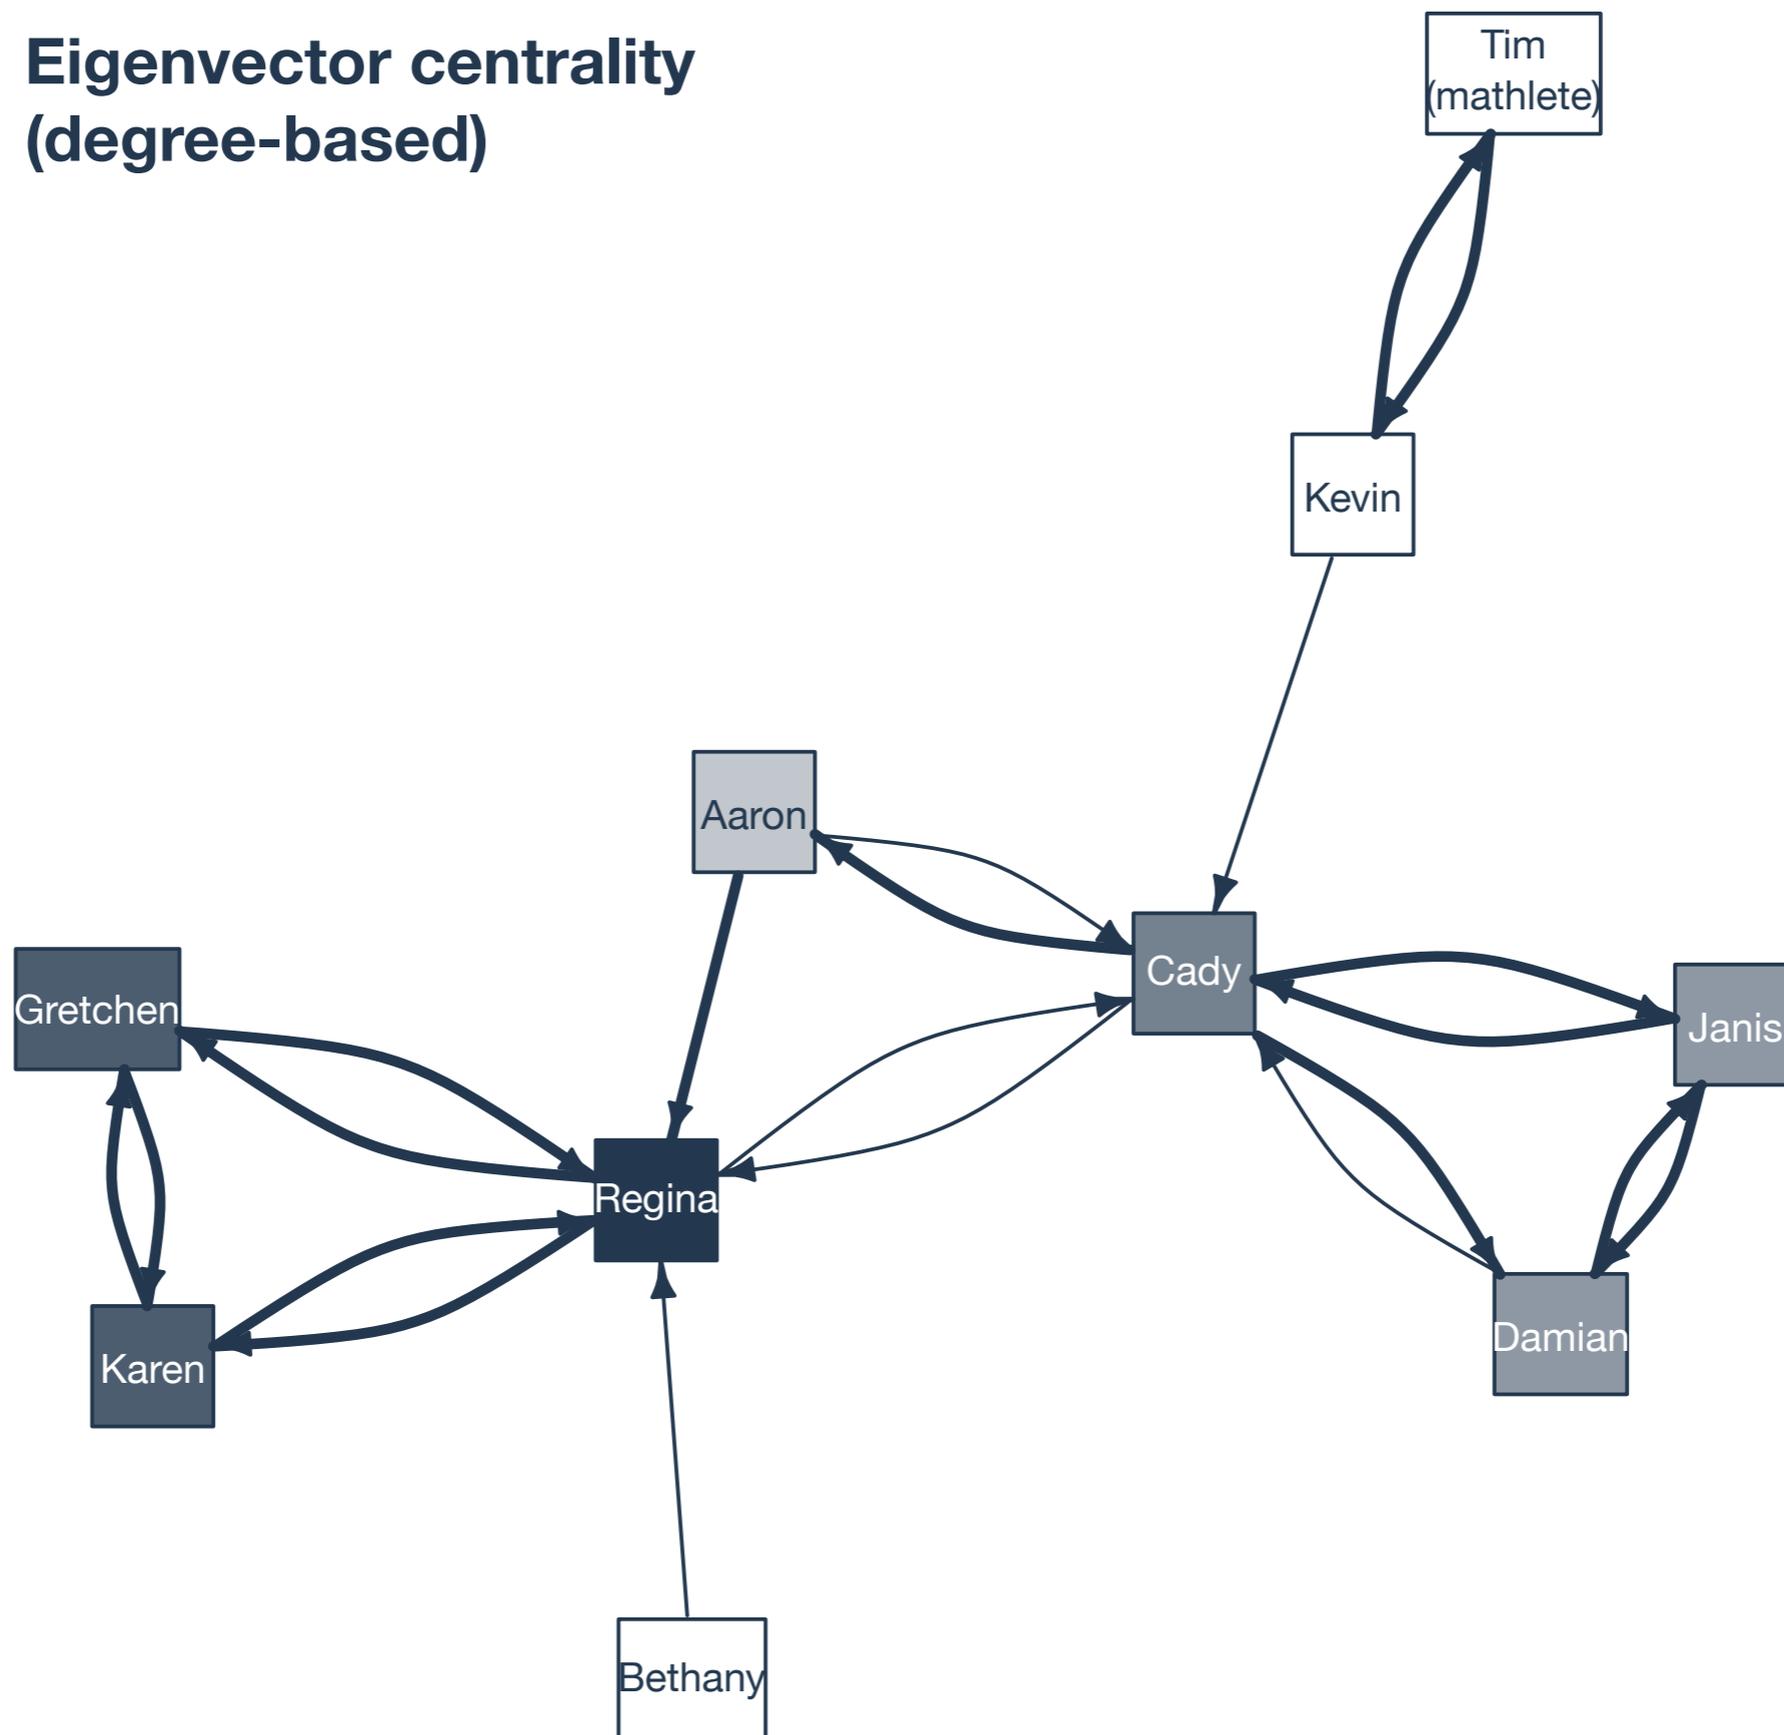

Mean Girls (2004)
